

## +GF+ Schedule 80 CPVC Hi-Temp Industrial Piping System

Plastic Systems' CPVC 'Hi-Temp' Schedule 80 piping system is a truly industrial product with special application in process pipework where high integrity and excellent chemical resistance are required.

### Chemical Resistance

CPVC (Chlorinated Polyvinyl Chloride) is particularly useful for handling corrosive fluids at temperatures up to 99°C. In chemical resistance, it is comparable to PVC. It weighs about one-sixth as much as stainless steel, will not sustain combustion (self-extinguishing) and has low thermal conductivity. Suggested uses include process piping for hot corrosive liquids, hot and cold water lines, and similar applications above the temperature range of PVC. CPVC pipe may be joined by solvent welding, threading or flanging.

### Solvent Cement Jointing

The Installation of CPVC Schedule 80 pipework should only be undertaken by suitably qualified and experienced persons. Please contact Plastic Systems for appropriate training.

Plastic Systems recommend the use of IPS-724 solvent cement when jointing CPVC Schedule 80. This has been specifically developed for use with CPVC Schedule 80 in chemical applications.

### Standards

CPVC Schedule 80 was initially developed for the American market and as such is made to the relevant ASTM Standards. Flanges are drilled to the ANSI 150 pattern and threaded fittings are NPT. Please note that this is different to the Table D/E flanges and BSP threads common to New Zealand.
